

Supplemental Instructions for DICE iPod Integration Kit for BMW X5 '03-'06 Equipped with Sirius Satellite Radio

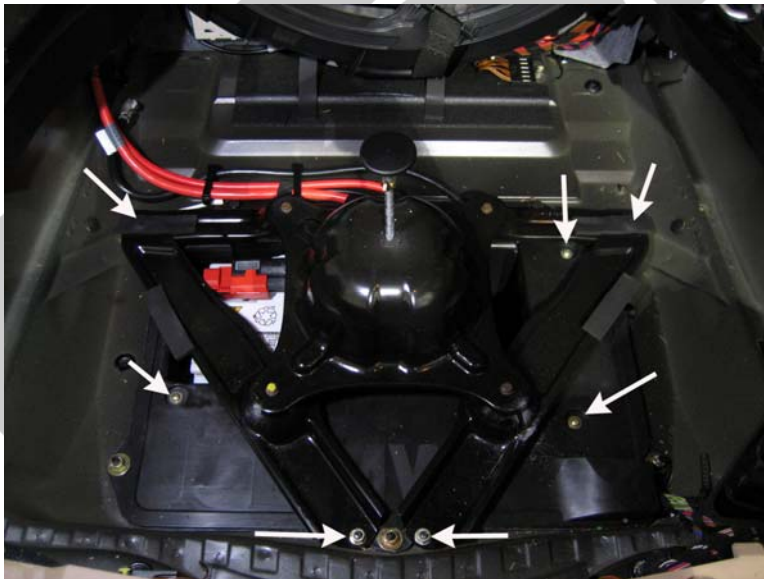

For complete instructions on how to install your DICE iPod integration kit, visit www.bavsound.com.

The factory Sirius module resides beneath the spare tire, which is located underneath the rear floor of the X5.

To access the module, you'll need to remove the spare tire and the large metal orb that hovers above the battery. With the tire removed, simply remove the four 13mm nuts/bolts and lift the piece up and towards the front of the car.

Also note the three arrows pointing towards the brass Philips head screws. Once the metal housing is free, you'll simply fold it upward and toward the front of the car, being careful not to pinch any hydraulic lines that may be routed to the components installed in the orb.

This will reveal a plastic panel with "BMW" written across it. Remove the Philips head screws, and the panel will lift out of the car. The Sirius Module will be installed down in the plastic housing around the radio tuner. It will be chrome in color, and you'll be able to access it fairly easily, depending on how the dealer attached it.

Plug the extension cable into the Sirius Module, and subsequently back into the Dice cable that you are routing to the front of the vehicle.
